WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, the total strength of the reporting units as shown herein has been consistently about one percent below the actual strength of the Army in the Continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or longer, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all traumas other than battle casualties (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications as well as various types of wounds not due to enemy action). Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. This ratio may not be significant when the strength of a Command is changing markedly or when a Command has a relatively large number of General Hospitals.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of total beds authorized and total beds occupied.

Unless otherwise specified, beds authorized as shown in this report are defined in par. 36h of AR 40-1080, C 2. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

Regional Hospitals are distinguished from Station Hospitals by the letters (RH) appearing after the name of the station. Likewise Convalescent Hospitals are denoted by the letters (CH).

In the case of General Hospitals there are shown, in addition, the number of Army patients admitted, the number disposed of during the week (by return to duty, transfer, death, CDD, or otherwise), and the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, subdivided by disease, injury, and battle casualty patients. The patient days of treatment are presented separately for hospital and for convalescent facilities. The bed capacity and beds occupied in convalescent facilities are also indicated.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 18 AUGUST 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

During the week ending 18 August 1944, the admission rate from all causes increased slightly to 553 per year per thousand strength, which is 1 percent above the rate for the previous week but only 5 percent above the minimum rate for 1944 registered during the last week of June. During the past three months, morbidity from all causes has fluctuated within the relatively narrow range of 530 to 566 per thousand.

The current week's admission rate from all diseases combined increased slightly to 482 per thousand, which is almost 30 percent lower than for the corresponding week of 1943.

Morbidity from injury remained at 71 per thousand and is about 25 percent lower than for the corresponding week of 1943.

Respiratory Causes:

Morbidity from colds, influenza, etc. increased fractionally to 68 per thousand, which however is more than 25 percent under the rate for the corresponding week of 1943. During the past two months the admission rate from these causes has varied only within the narrow limits of 65 to 68 per thousand, which is considerably below the lowest rate experienced during any week of 1942 or 1943.

The admission rate from pneumonia remained at 6 per thousand or about one-third lower than for the corresponding week of 1943.

Common Communicable Diseases:

Morbidity from venereal disease, excluding cases

contracted prior to entry into active service, increased to 37 per thousand, the second highest rate registered this year. Current morbidity from these causes is about 35 percent higher than during the corresponding week of 1943.

The admission rate from diarrhea and dysentery decreased from 11 per thousand to 10 per thousand for the current week, which is less than half the rate for the corresponding week of 1943.

The number of new cases of meningitis continued at a level of 20 new cases per week. The number of new cases of rheumatic fever decreased to the lowest level reported so far this year. The number of new cases of poliomyelitis was again reported at 6 for the current week.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

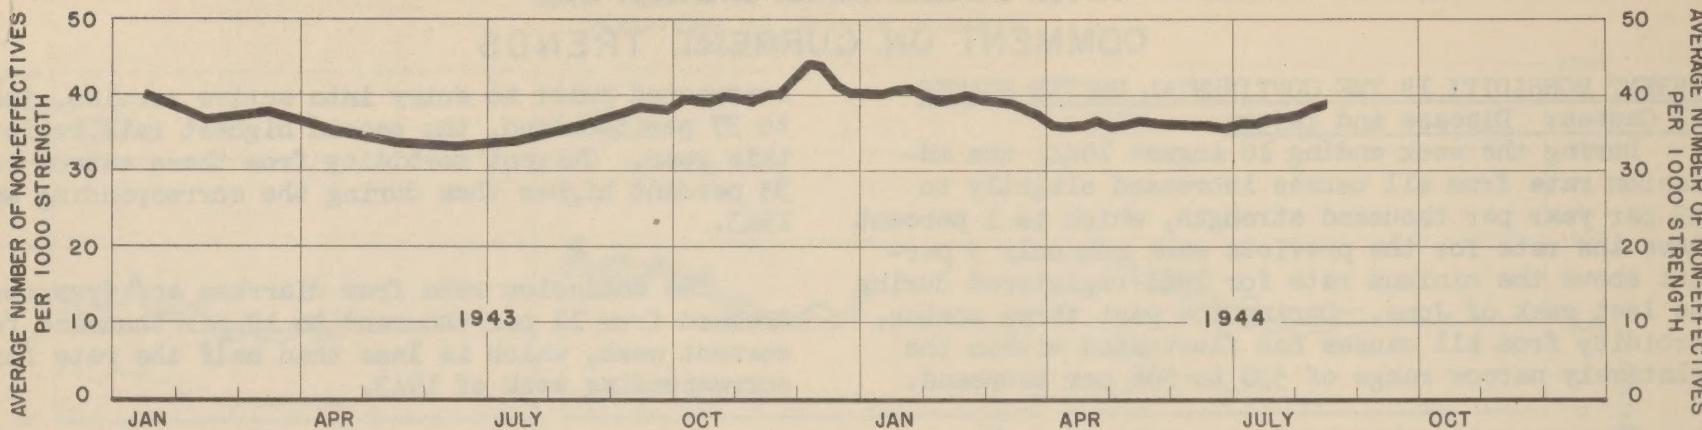

All Causes: Disease and Injury:

The admission rate from disease increased in all Service Commands except the Fourth and Sixth, where slight decreases were recorded. Increases of more than 5 percent (but less than 10 percent) occurred in the First, Second, and Ninth Service Commands. The increase in the First Service Command was accounted for in part by higher morbidity from venereal disease, while in the Second Service Command the predominant factor was a sharp rise in the morbidity from colds, influenza, etc. In the Fourth Service Command part of the decrease in morbidity was attributable to a somewhat smaller number of cases admitted for purposes of discharge at the Separation Center, Ft. McPherson, Ga.; this station continued to show unusually high admission rates because of such activity.

The Second Service Command reported the highest

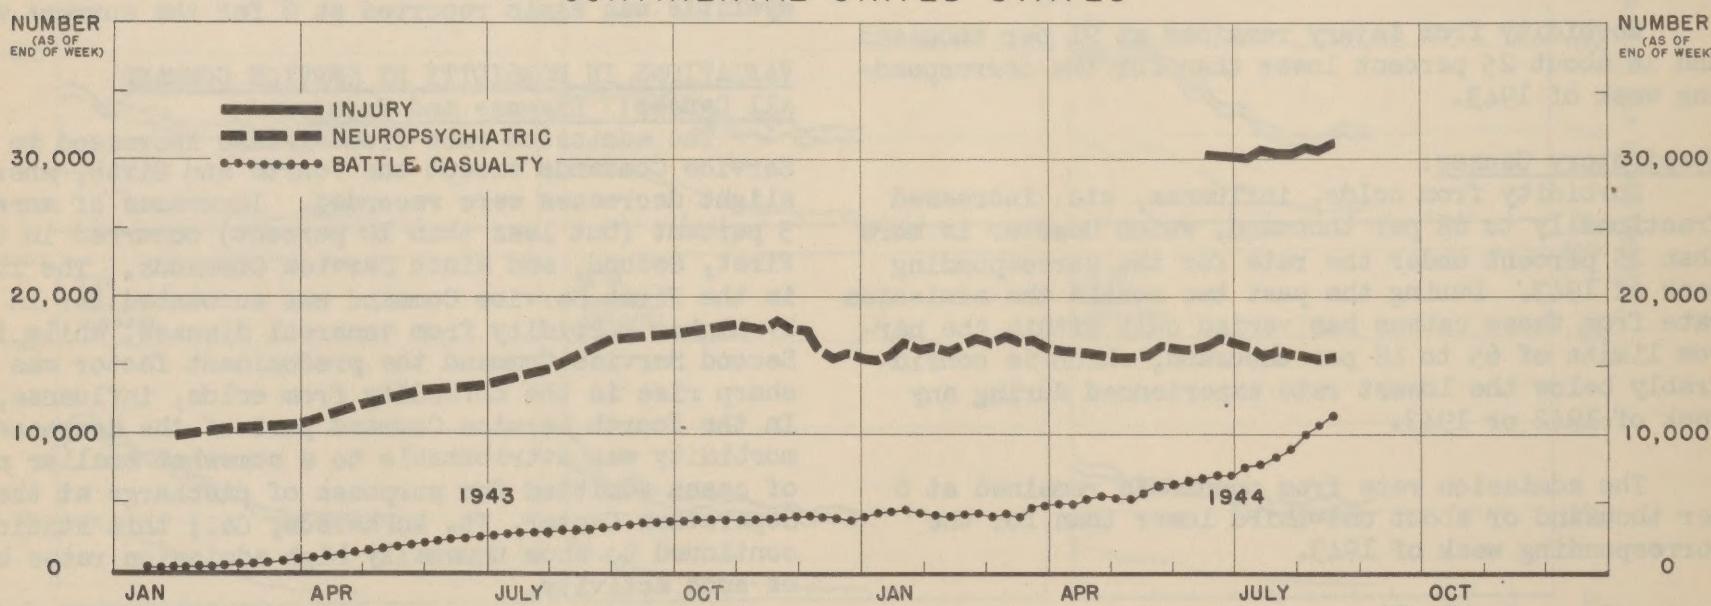

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

COMMENT ON CURRENT TRENDS (CONT'D)

morbidity from all causes (686 per thousand) and from disease (614 per thousand). The Military District of Washington reported the next highest morbidity rates, in part because of admissions for casualties passing through Washington, D. C. (usually treated at Ft. Myer). The lowest morbidity from all causes and from disease was reported by the Eighth Service Command with rates of 520 and 443 per thousand respectively; this is the third consecutive week that this Command has reported the lowest morbidity.

Although the admission rate from injury for the country as a whole remained the same as for the previous week, there were considerable variations by Service Commands. Sharp increases were recorded by the Second and Ninth Service Command and the Military District of Washington, while decreases were registered in the Sixth, Seventh, and Eighth Service Commands. The Fifth Service Command with a rate of 79 per thousand reported the highest morbidity from this cause, while the First and Sixth Service Commands with rates of under 60 per thousand were the lowest.

Respiratory Causes:

Most Service Commands reported about the same admission rates from colds, influenza, etc. as during the previous week. However, sharp increases were registered in the Second and Third Service Commands. As a result, the Second Service Command reported by far the highest morbidity from these causes (127 per thousand) and was the only Command with a rate in excess of 80 per thousand. Out of the 13 stations in the Second Service Command with strength of 2500 or more 6 had admission rates from colds, influenza, etc. in excess of 100 per thousand. The Fifth, Sixth, and Seventh Service Commands reported the lowest morbidity from these causes, all having rates under 60 per thousand.

The Second Service Command and the Military District of Washington showed sharp increases in morbidity from pneumonia. As a result, these two Service Commands along with the Sixth reported the highest admission rates (about 10 per thousand) from this cause.

Common Communicable Diseases:

Morbidity due to "new" venereal (excluding EPTS) cases increased in every Service Command except the Third, Fifth, and Sixth. Except in the First Service Command the increases were of relatively small magnitude. In the First Service Command the admission rate rose by more than 20 percent, in part as a result of increased admissions at Boston PoE. The First, Second, and Fifth Service Commands all reported morbidity from these causes in excess of 50 per thousand. The relatively high morbidity in the First and Second Service Commands is due in large part to the high incidence among task force troops not under the jurisdiction of the Commands.

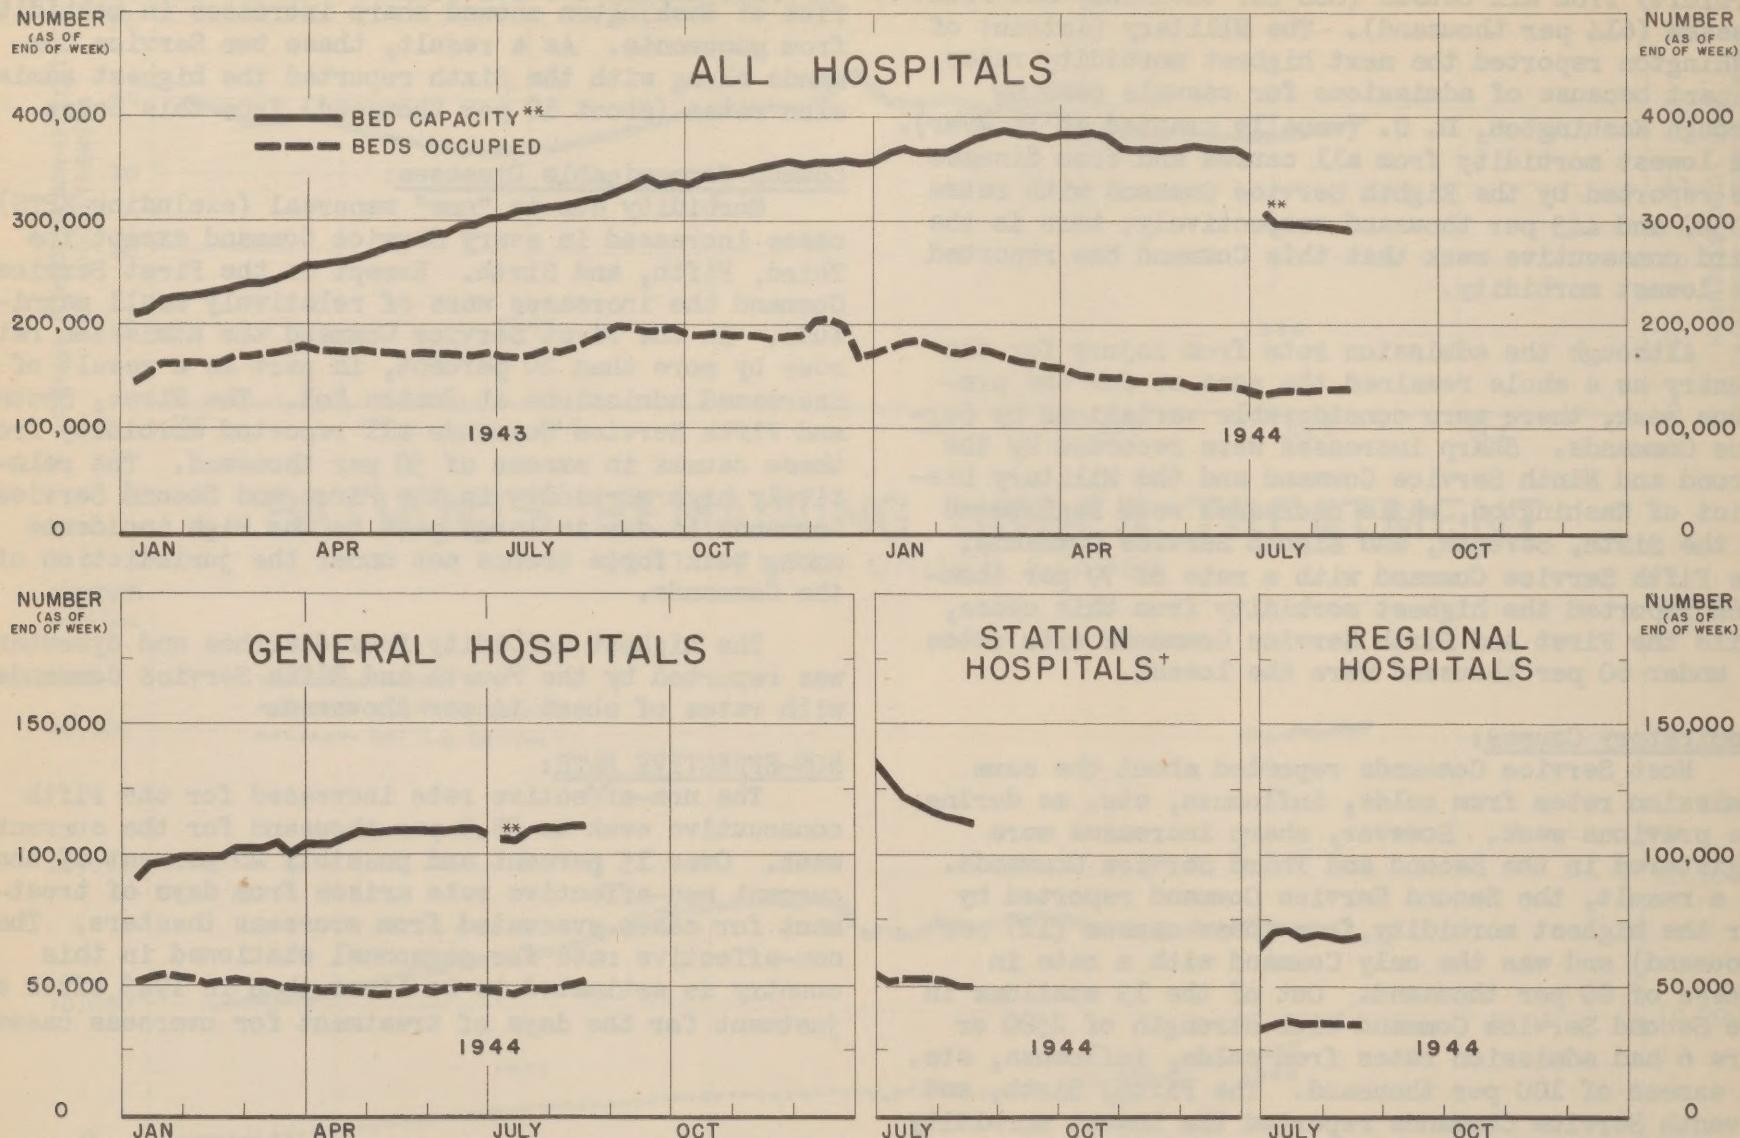

The highest morbidity from diarrhea and dysentery was reported by the Fourth and Fifth Service Commands with rates of about 14 per thousand.

NON-EFFECTIVE RATE:

The non-effective rate increased for the Fifth consecutive week to 38.9 per thousand for the current week. Over 15 percent and possibly 20 percent of the current non-effective rate arises from days of treatment for cases evacuated from overseas theaters. The non-effective rate for personnel stationed in this country is estimated to be lower than in 1943 after adjustment for the days of treatment for overseas cases.

HOSPITALIZATION DATA*

CONTINENTAL UNITED STATES

*EXCLUSIVE OF BEDS REPORTED IN DISPENSARIES, CONVALESCENT FACILITIES,
VENEREAL DISEASE FACILITIES, AND COLLEGE TRAINING UNITS.

**AFTER JUNE 1944 DATA ARE FOR AUTHORIZED BEDS

⁺ ALSO INCLUDES BEDS IN NON-FIXED HOSPITALS AT MANEUVER AREAS.

ARMY SERVICE FORCES, OFFICE OF THE SURGEON GENERAL
MEDICAL STATISTICS DIVISION, HEALTH REPORTS BRANCH

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week represented a rate of 38.2 per thousand strength, or about 2 percent higher than the previous week. The number of neuro-psychiatric cases remaining as of 18 August 1944 was reported at 15,581 or about 100 more than the previous week.

The number of non-battle injury patients remaining under treatment in hospital and quarters as of 18 August 1944 totaled about 31,100 or more than 1,000 in excess of the number at the beginning of July. The number of battle casualty patients remaining increased by more than 700 to 11,460; all but 526 of these were in General Hospitals.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 18 August 1944 the total number of enlisted men discharged by CDD was 3,320 or about the same as the previous week and the highest number recorded since such data have been reported (in July and subsequent). Almost one-half of these discharges were reported by General Hospitals.

CURRENT HOSPITAL CONDITIONS:

The total authorized beds as of 18 August 1944 numbered about 292,000 or 1,000 less than at the end of the previous week. The total number of beds occupied was 138,000 (or 47 percent of the total beds authorized) which was about 2,000 more than at the end of the previous week and the highest number occupied since 23 June 1944. Included in the total authorized beds were 258 T/Q hospital beds and tentage, none of which were occupied.

The total authorized beds in General Hospitals numbered 111,088 which was a decrease of about 200 over the previous week, due to a reduction in beds

at England G.H. The total number of beds occupied in General Hospitals was 52,305 (or 47 percent of the authorized beds) which was about 2,300 more than at the end of the previous week.

Station hospitals (as distinct from Regional Hospitals) reported about 112,000 total authorized beds, while Regional Hospitals reported about 69,000 beds. The number of beds occupied at station hospitals was about 50,000 or 45 percent of total authorized beds. The beds occupied at Regional Hospitals numbered about 36,000 or 52 percent of total authorized beds. Ten stations (De Ridder AAB, La., Brookley Field, Ala., Aliceville PW Camp, Ala., Mississippi Ordnance Plant, Miss., Camp Adair, Ore., Hamilton Field, Calif., Lemoore AAF, Calif., Stockton Ordnance Depot, Calif., St. Petersburg C.H., Fla., and Santa Ana AAB, Calif.) reported more beds occupied than authorized beds; the first eight of these were in this same category last week.

Included among the station hospitals are eight which are designated as Convalescent Hospitals (ZI); these reported 3,017 authorized hospital beds (1,703 occupied) and in addition 10,673 beds in convalescent facilities (1,353 occupied).

The bed capacity of convalescent facilities in General Hospitals was 19,304. The total beds occupied in such convalescent facilities was 6,875 or 36 percent of the total bed capacity.

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 28 JULY 1944

COMMENT ON RECENT DEVELOPMENTS

NATURE OF THE DATA:

The data of this Supplementary Report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However, unlike the Weekly Health Reports which are compiled on the basis of the figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the four week period ending 28 July 1944 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Health Report.

This Supplementary Report covers morbidity and mortality data for all individual stations with a strength of 1000 or over and gives details for admissions from venereal diseases and for neuropsychiatric cases.

Charts showing morbidity trends from all causes, from all diseases combined, from injury, and from colds, influenza, etc. are presented on page 35. Similar charts for specified diseases appear on pages 37, 39, and 41. A chart showing mortality trends is presented on page 43. A summary for the month of the number of admissions and corresponding morbidity rates and of the number of deaths and corresponding mortality rates for the United States as a whole and for the Service Commands is given on page 44. The most pertinent morbidity data for individual stations are presented on pages 45 to 70. On pages 71 and 72 the six stations with the highest rates of admission during the month are shown for each of the morbidity cate-

gories considered.

In reading the detailed tables, it should be borne in mind that morbidity (or mortality) rates based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases. Attention is directed to the definitions of admissions and admission rates and the discussion of the proportion of total Army strength included in the stations covered by this Report as given on Page 2. Hereafter, the term "month" in this report is used to denote the four or five week period based on the number of Fridays in the calendar month.

MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY

Morbidity from all causes and from disease was lower in July than in June, but the decreases in the respective admission rates were the smallest recorded so far this year - both being only about 2 percent. The admission rate from disease has declined more than 50 percent from the peak rate recorded for December 1943, the decrease being almost entirely accounted for by lower morbidity from colds, influenza, etc. The admission rate from all causes for July, at 545 per year per thousand strength, was at the lowest point for this war and almost 25 percent below the rate for July 1943.

The admission rate from injury increased for the third consecutive month to 79 per thousand (or 8 percent higher than the June rate) and is at the highest level since September 1943. Nonetheless, the current

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

level of morbidity from injury is about 15 percent under that for the corresponding month of 1943.

Slightly lower morbidity from disease during July as compared with June was reported by every Service Command except the First, Second, Third and Ninth, in which slight increases were registered.

The Second Service Command reported in July the highest admission rates from all causes and from disease (both about 10 percent higher than for the country as a whole). The lowest admission rates from all causes and from disease were again registered in the Sixth Service Command (both about 10 percent under those for the United States as a whole); the Seventh and Eighth Service Commands however reported morbidity from disease only slightly higher than the Sixth Service Command. The First, Third, Fourth, and Fifth Service Commands all experienced morbidity from disease within 2 percent of the rate for the total United States.

RESPIRATORY DISEASES:

The admission rate from colds, influenza, etc. decreased from 77 per thousand in June to 66 per thousand in July, a decline of about 15 percent. The rate for July was 35 percent lower than for July 1943 and 88 percent under the peak rate of December 1943. In fact, current morbidity from this cause is at the lowest level recorded during this war, being about 30 percent below the previous record low for 1942 or 1943 established in August 1943.

Unlike in previous months, the decreases in morbidity from colds, influenza, etc. in July did not occur uniformly in all Service Commands; the Fourth Service Command, which had been at unusually low level in June reported higher morbidity from these causes in

July. The largest decreases in morbidity were registered in the Third, Sixth, Seventh, Eighth and Ninth Service Commands and the Military District of Washington.

The highest morbidity from colds, influenza, etc. was reported by the Second Service Command (about 85 per thousand); this level of morbidity is seen to be quite low in comparison with that experienced during July 1943, when the rate for the country as a whole was about 20 percent higher. All Service Commands other than the Second reported admission rates from colds, influenza, etc. of less than 75 per thousand; rates of about 60 per thousand were reported by the Third, Sixth, Seventh and Eighth Service Commands and the Military District of Washington.

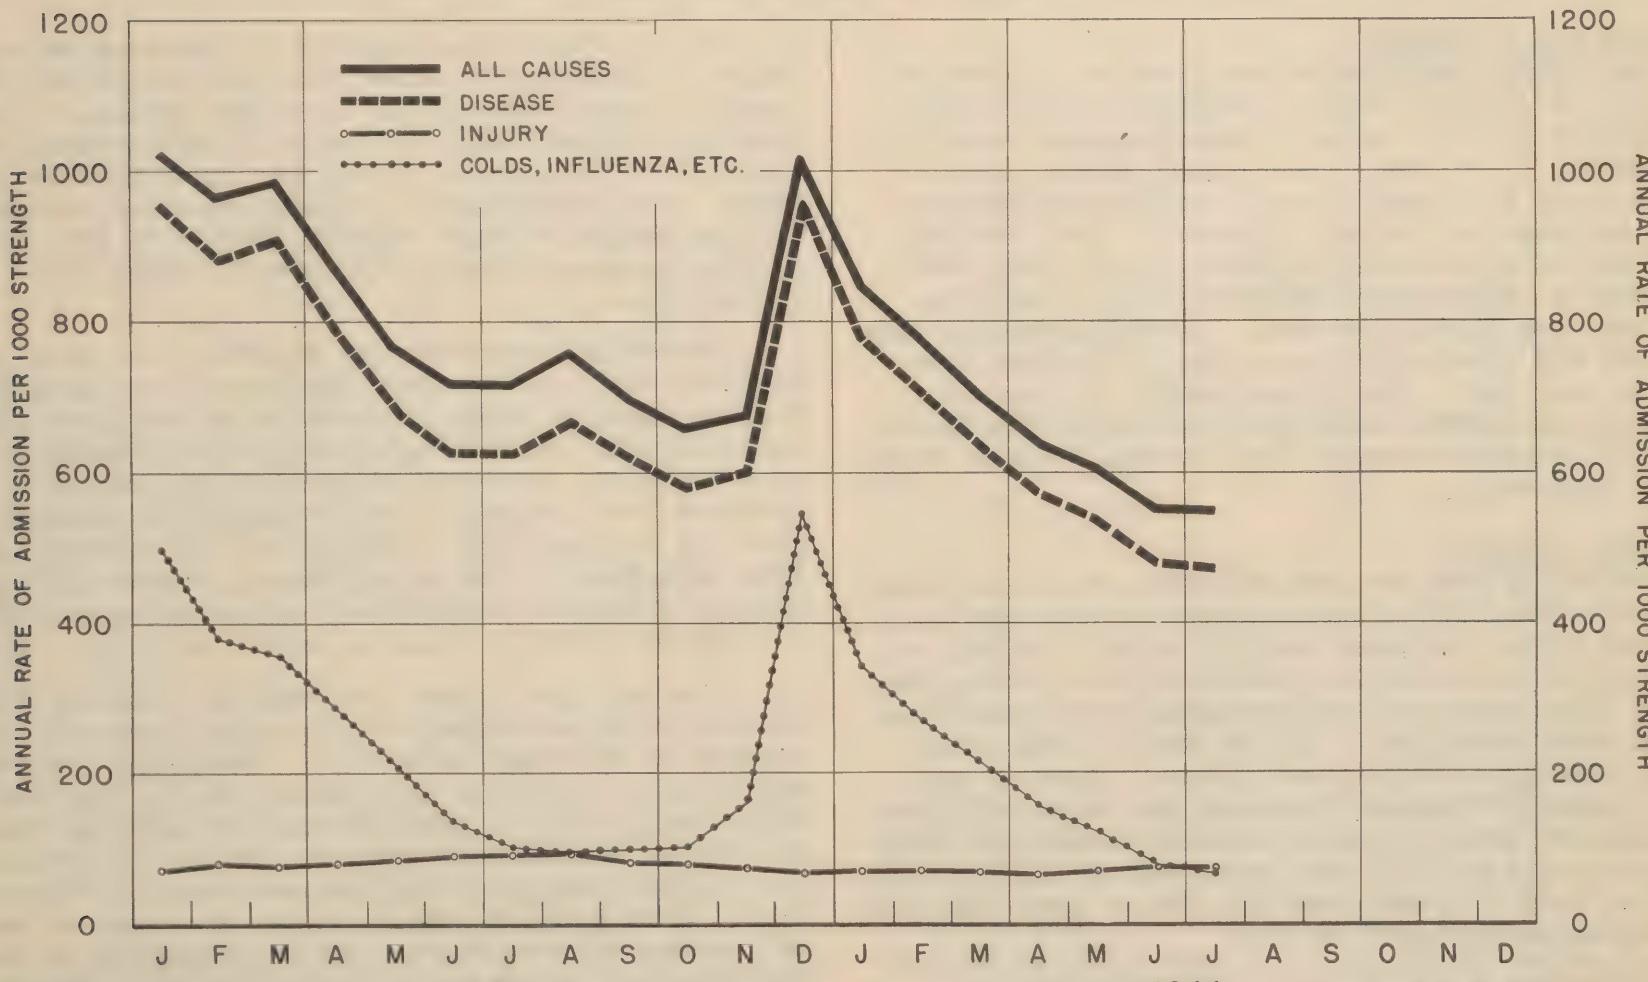

Morbidity from all forms of pneumonia decreased somewhat in July. The admission rate of 6.5 per thousand for July was almost 20 percent lower than for June and about 35 percent below the rate for July 1943. Current morbidity from this cause is at exactly the same level as the previous record low for this war (July 1942). The Sixth Service Command continued to report by far the highest morbidity from this cause; even though the July admission rate in this Service Command was about 30 percent lower than the June rate, it was more than 60 percent above the July rate for the country as a whole. The lowest morbidity from pneumonia during July was reported by the First, Seventh, and Ninth Service Commands, all of which had rates of about 5.5 per thousand.

Atypical pneumonia accounted for more than two-thirds of the total admissions from pneumonia, the highest proportion thus far recorded. The percentage of pneumonia cases diagnosed as atypical was highest

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT

in the First, Fourth, Sixth, and Eighth Service Commands and the Military District of Washington in all of which the proportion was at least 75 percent.

DIARRHEA AND DYSENTERY:

Morbidity from diarrhea and dysentery increased slightly in July (by about 5 percent). During 1943 the admission rate from this cause increased steadily and rapidly in the spring and summer months reaching a relatively high peak in July, but during 1944 the trend has been only slightly upward. Thus, the July 1944 rate is only about 35 percent higher than that for January, whereas the corresponding increase in 1943 was more than 400 percent. Current morbidity from diarrhea and dysentery is more than 50 percent lower than in July 1943. The highest morbidity from this cause in the current month was reported by the Fourth and Fifth Service Commands (both having rates of about 17 per thousand).

VENEREAL DISEASE:

Morbidity from venereal diseases, excluding cases contracted prior to entry on active service (designated as EPTS), increased sharply in July to 35.2 per thousand (or more than 10 percent higher than the June rate). This is the highest admission rate from these causes since March 1942. In the face of this relatively unfavorable experience from all forms of venereal disease, it should be noted that morbidity from syphilis has been decreasing steadily during the past two years; the syphilis admission rate of 3.8 per thousand for July 1944 was about 35 percent lower than for the corresponding month of 1943.

Increases in morbidity from venereal diseases were reported by all Service Commands except the First

DEVELOPMENTS (CONT'D)

and the Military District of Washington; the greatest increases were registered in the Third, Sixth, and Seventh Service Commands.

In July the highest morbidity from venereal disease, excluding EPTS cases, was reported by the Fifth Service Command with a rate of 50 per thousand. Relatively high morbidity, of about 40 per thousand, was reported by the Second, Third, and Sixth Service Commands. The Second Service Command reported a relatively high admission rate, chiefly because of the incidence among task force troops not under its jurisdiction.

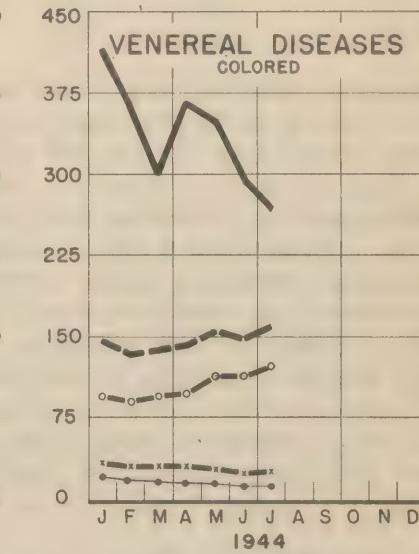

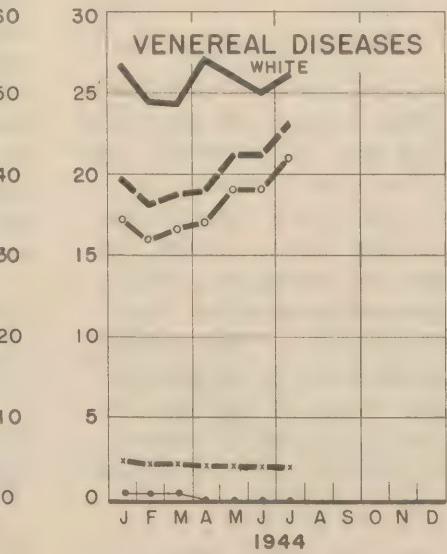

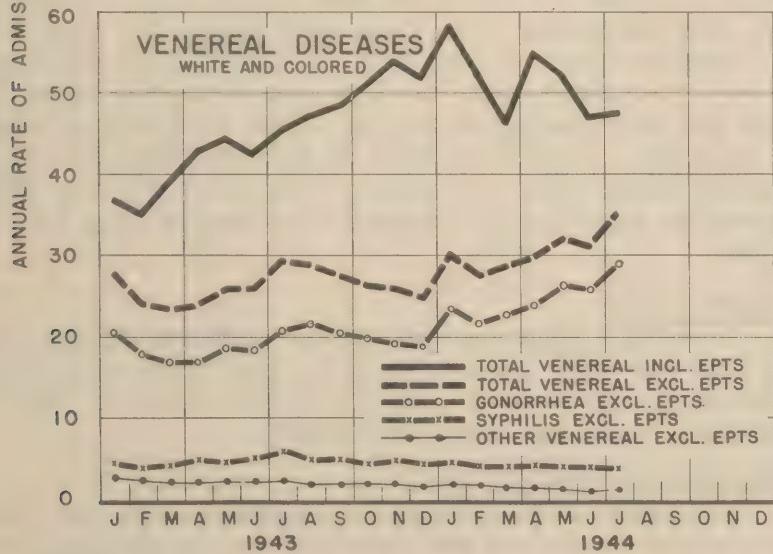

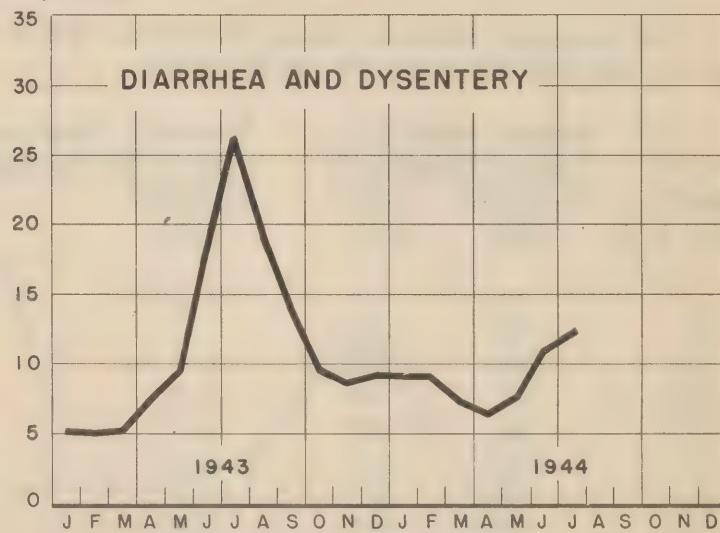

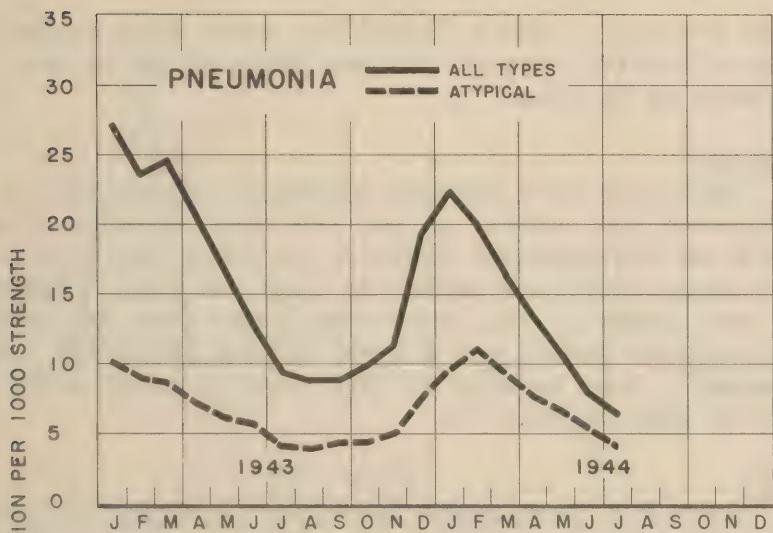

Morbidity represented by venereal EPTS cases was reported at 12 per thousand during July as against 15 per thousand for June. The admission rate from this cause has been decreasing steadily during recent months as a result of the downward trend of the number of men inducted into the Army. Variations in the admission rate for venereal EPTS cases as between Service Commands have relatively little significance, because they reflect a different geographical and racial distribution of Army personnel as compared with that of new inductees.

The very much higher incidence of venereal disease among colored as contrasted with white personnel is indicated in the chart on page 37. Morbidity from venereal disease, excluding EPTS cases, has in 1944 been consistently about 7 times as high for colored troops as for the remainder of the Army, while for EPTS cases the colored admission rate has been about 30 times as high. More detailed data as to the incidence of venereal disease by rate during June are presented in the Supplementary Health Report contained in the Weekly Health Report No. 30 (page 38).

MORBIDITY FROM —

PNEUMONIA
DIARRHEA AND DYSENTERY
VENEREAL DISEASES

CONTINENTAL UNITED STATES

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

The venereal disease cases remaining under treatment at the end of July are shown below.

Service Command	Number Remaining under treatment		Venereal Disease Cases as % of All Cases	
	Syphilis	Other	Syphilis	Other
TOTAL U.S.	1581	2193	1.09	1.51
I	55	35	1.4	.9
II	81	150	.7	1.4
III	166	207	1.7	2.2
MDW	61	26	1.5	.6
IV	326	389	1.0	1.2
V	150	255	1.5	2.6
VI	38	147	.6	2.2
VII	67	217	.5	1.6
VIII	331	470	1.1	1.6
IX	306	297	1.3	1.3

The great bulk of the cases remaining were contracted after entry on active service. The number of syphilis cases remaining at the end of July was 26 percent higher than in June, while for other venereal cases the corresponding increase was only 6 percent. Syphilis cases represented 1.09 percent of the total number of patients remaining under treatment in hospital, while gonorrhea and other venereal diseases accounted for 1.51 percent of all patients in hospital. The very much longer duration of hospitalization for syphilis is indicated by the fact that less than 11 percent of the total venereal admissions (excluding EPTS cases) were for this cause, but over 40 percent of the cases remaining under treatment were for syphilis.

The total number of days lost from duty during July because of some venereal disease was about 90,000

or an average of about 22,500 per week; this represented a non-effective rate of .80 per thousand which was about the same as in June.

MEASLES:

Morbidity from measles decreased seasonally to the relatively low rate of .4 per thousand, which is about as low as the seasonal minimums recorded during the late summer and fall months of 1942 and 1943. However, the peak rates in 1944 were much lower than during the two previous years, and a level of low incidence has apparently been reached in 1944 about a month earlier than in 1942 or 1943.

MUMPS:

Morbidity from mumps decreased by almost 50 percent in July or by about as much as in June. Nevertheless, the admission rate from this cause for July was six times as high as that for either measles or scarlet fever. It appears that in 1944 the admission rate for mumps has declined more rapidly than in previous years. The July 1944 morbidity rate of 2.4 per thousand is somewhat lower than for either July 1942 or July 1943 but may be expected to decrease further during the fall months.

SCARLET FEVER:

Morbidity from scarlet fever declined sharply in July and was at a rate of only .4 per thousand. This is believed to be close to the minimum level that may be anticipated for the next few months.

MENINGOCOCCIC MENINGITIS:

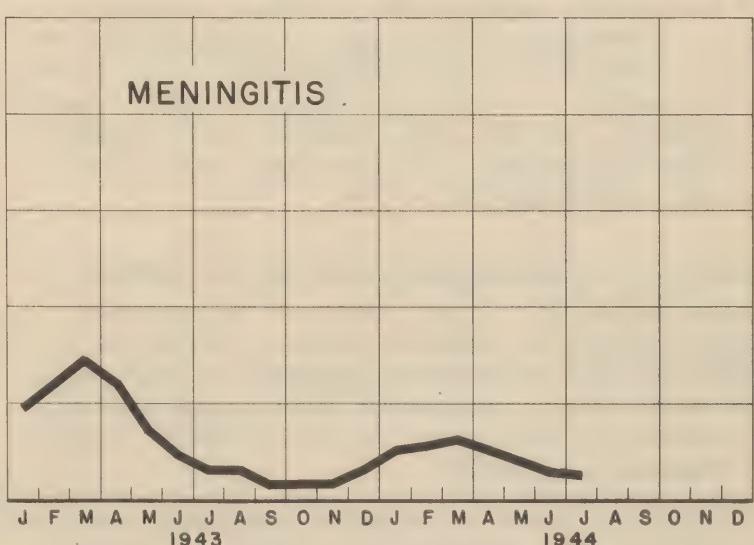

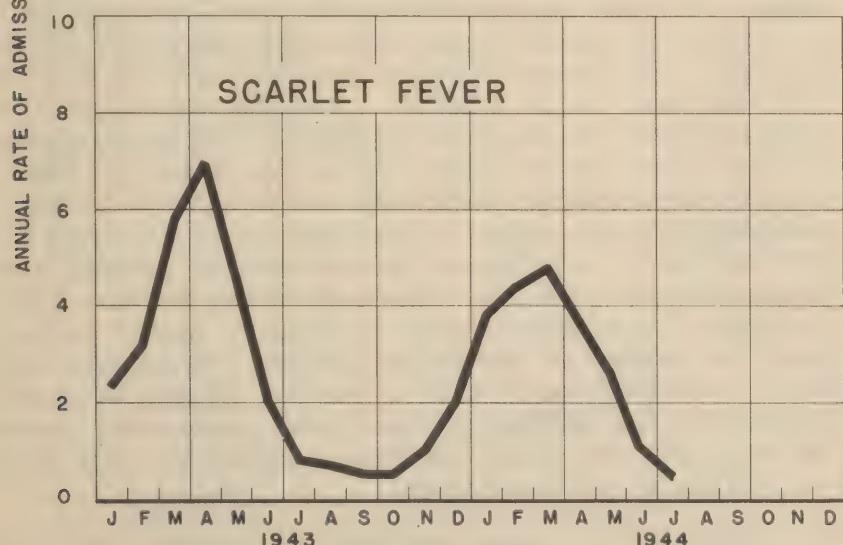

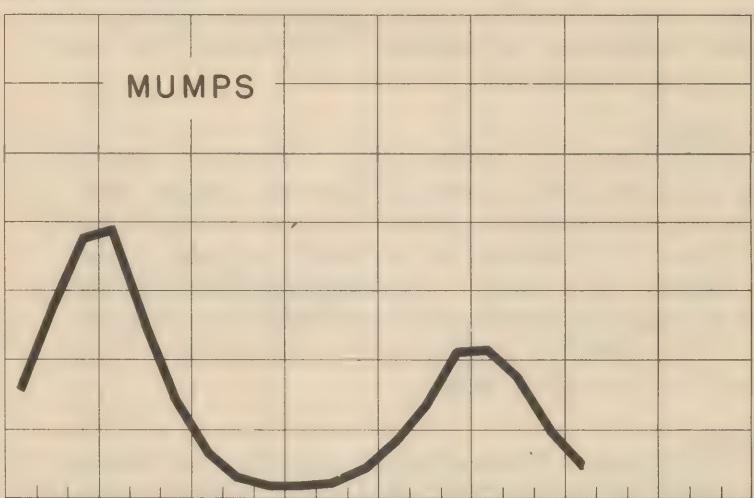

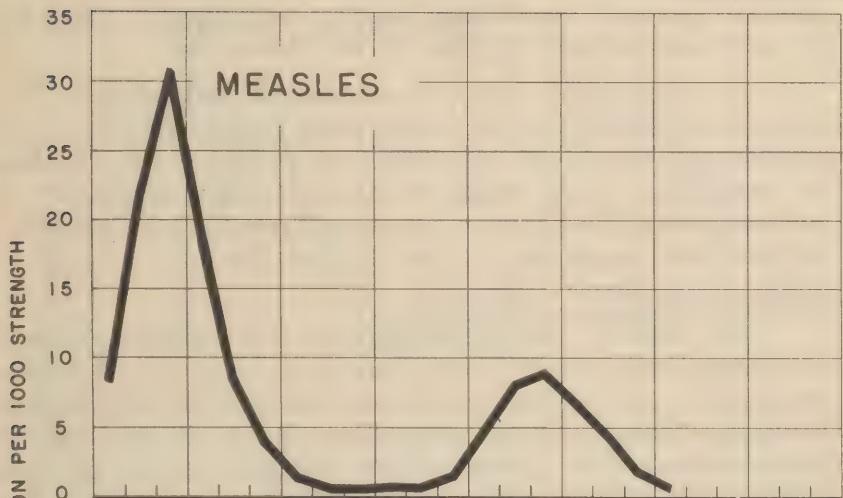

Morbidity from meningitis decreased for the fourth consecutive month and was reported at .5 per thousand for July. This is slightly below the rate for July 1943

MEASLES — MUMPS

SCARLET FEVER — MENINGITIS

CONTINENTAL UNITED STATES

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

but somewhat above the low level reported during the period from September to November 1943 when the rate was only .3 per thousand.

RHEUMATIC FEVER:

Morbidity from rheumatic fever decreased sharply during July and was almost 50 percent under the peak rates reported during March to May of this year. Morbidity from this cause is currently at the same level as during July 1943. The Seventh Service Command with a rate almost four times that for the remainder of the country continued to report the highest morbidity from this cause.

TUBERCULOSIS:

Morbidity from tuberculosis continued at about the same level as during the past year, which is considerably below that experienced in 1942. As of 28 July 1944 there were 1153 cases of tuberculosis remaining under treatment; these represented .79 percent of the total number of patients remaining under treatment in hospital. Of the 1153 cases of tuberculosis remaining under treatment, 704 (or more than 60 percent) were at Fitzsimons G. H.

MALARIA:

Morbidity from malaria acquired in the United States was reported at .2 per thousand or somewhat under the rate for the previous month. In previous years there has been a seasonal increase in morbidity from this cause during the summer with a peak in July; in 1944 however the July rate is only slightly higher than for the previous months.

The number of cases of malaria presumably acquired overseas admitted for treatment in hospitals in this country during July averaged about 725 per week or more

than 20 percent above the weekly average for June and by far the highest figure so far recorded.

As of 28 July 1944 there were 2,286 cases of malaria remaining under treatment representing 1.58 percent of the total patients remaining under treatment in hospital. Only about 50 of the 2,286 cases of malaria remaining under treatment were those where malaria was acquired in the United States.

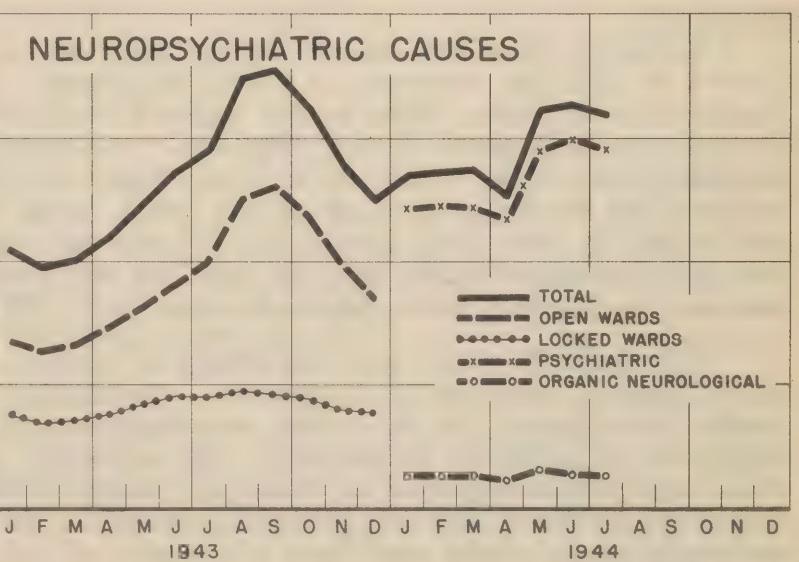

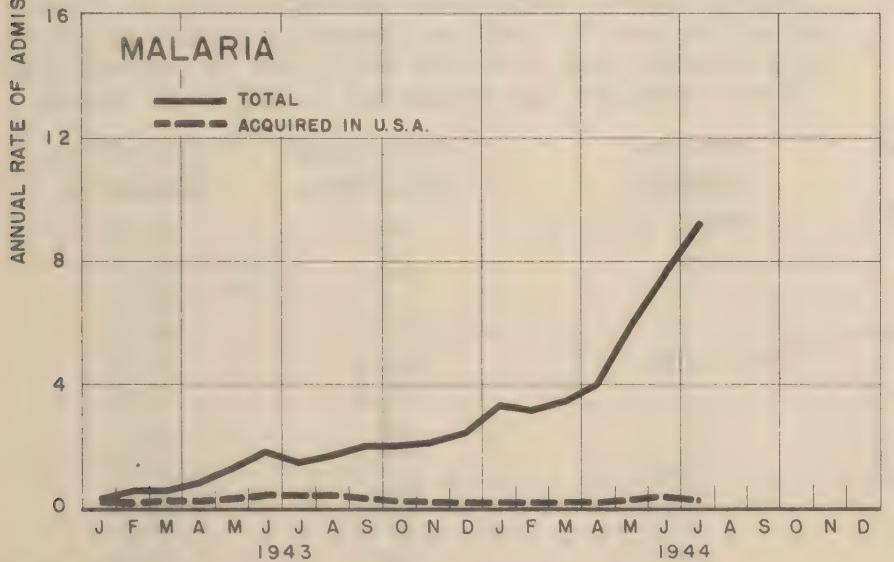

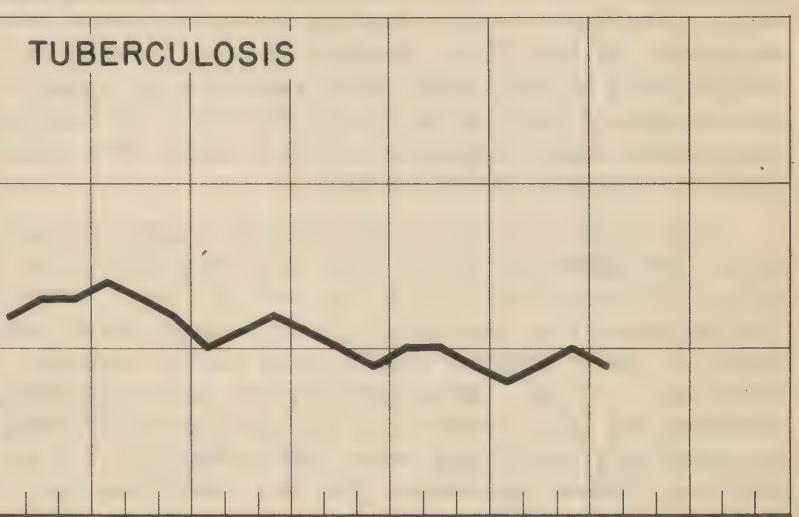

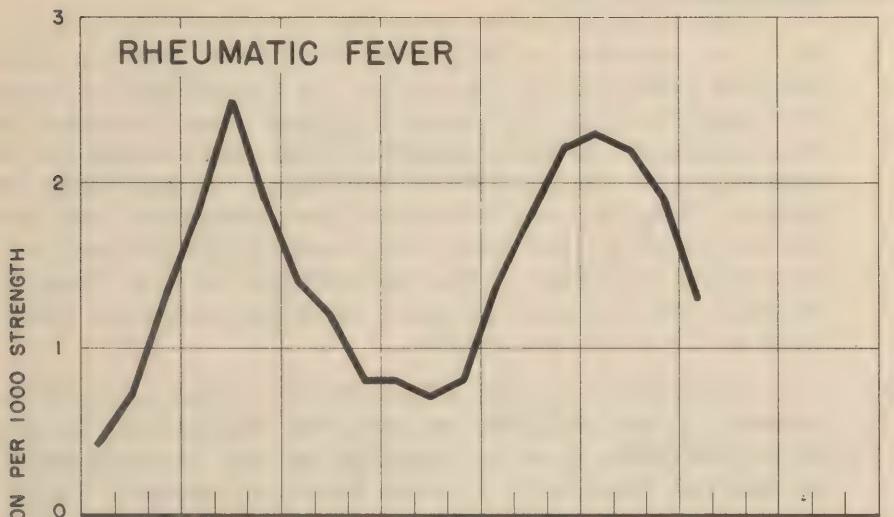

NEUROPSYCHIATRIC DISORDERS:

The annual rate of admission for neuropsychiatric disorders decreased fractionally in July to 31.8 per thousand. During the previous two months substantially the same level of morbidity from these causes had been experienced; this level is the highest since the fall months of 1943. The current admission rate from these causes is about 10 percent higher than for July 1943 and about 50 percent higher than for the early months of 1943. The Second Service Command, despite a 15 percent decrease in the rate of admission, continued to report by far the highest morbidity from these causes (60 per thousand or almost double the rate for the country as a whole); this high rate reflects in part a relatively large number of admissions at Atlantic City AAF Redistribution Center and at several General Hospitals in this Command. The only other Service Command to report an admission rate from these causes appreciably in excess of the United States average was the First Service Command with a rate of 39 per thousand. Relatively low morbidity from these causes was reported by the Fifth and Sixth Service Commands and the Military District of Washington.

Psychiatric cases continued to account for slightly more than 90 percent of the total neuropsychiatric

MORBIDITY FROM — RHEUMATIC FEVER — TUBERCULOSIS MALARIA — NEUROPSYCHIATRIC CAUSES

CONTINENTAL UNITED STATES

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

admissions. As in previous months this same proportion prevailed in most Service Commands, with the exception of the First Service Command (where only two percent of the cases were recorded as organic neurological) and the Military District of Washington (where over 30 percent of the cases were diagnosed as organic neurological).

The number of neuropsychiatric cases remaining under treatment as of 28 July 1944 was 15,793 or about 650 less than as of the end of June. Most of the decrease was accounted for by locked ward cases which in June reached the highest level reported thus far in 1944. Neuropsychiatric cases remaining represented 10.9 percent of all patients remaining in hospital; open ward cases accounted for 7.5 percent and locked ward cases for the remaining 3.4 percent of the total.

MORTALITY:

Mortality from all causes during July was reported at 2.74 per thousand or about 20 percent higher than in June. This is the highest death rate recorded for any month during this war. The reported mortality rate from injury of 2.11 per thousand accounted for the major portion of the total death rate. The mortality rate from disease at .63 per thousand was only somewhat higher than in June but was nevertheless the highest rate recorded since April 1943.

It should be noted that reporting of deaths on Forms 86ab is known to be incomplete, especially for deaths from injury for which the understatement may have been as great as 25 percent. The mortality rate from injury when adjusted to allow for under-reporting would be about 2.6 per thousand, resulting in an estimated total death rate from all causes of 3.2 per thousand.

NON-EFFECTIVE RATE:

The non-effective rate for July was reported at 36.6 per thousand strength or about the same as June. Despite lower admission rates the non-effective rate for July 1944 was 11 percent higher than for July 1943; this increase is more apparent than real since it is entirely the result of the inclusion of days lost in General Hospitals by evacuees from overseas (who account for at least 15 percent, and possibly 20 percent, of the non-effective rate). The non-effective rate from injury in July was 7.7 per thousand strength which is about the same as in previous months.

Variations in the non-effective rate by Service Command do not reflect so much the variations in morbidity between Service Commands as the varying number of General Hospitals in each Service Command. When comparisons are made between the non-effective rates excluding General Hospitals, the variations in the non-effective rate by Service Command are seen to be very much smaller than when the days lost in General Hospitals are included, as evidenced in the table below:
